

## OUR STRENGTHS

**HYGIENE AND SAFETY:** the assembled surfaces are easy to clean and disinfect, and the absence of sharp edges or parts which could pose a hazard in the event of impact make them safe during use.

**ERGONOMICS:** the control devices are always positioned to facilitate their use and make them quickly accessible; the electrical sockets and controls are arranged so they are always visible, identifiable and within easy reach of the patient or health care workers.

**VISUAL COMFORT:** the use of microprismatic diffusers prevents glare and matte diffusers improve the quality of the light, making hospital stays more comfortable.

**QUALITY:** each product is entirely assembled in our facility and uses components and semi-finished parts supplied by leading Italian and European companies. Each device is individually tried and tested using dedicated electronic analysers.

**DURABILITY:** the thickness of the extruded aluminium profile used in their construction guarantees the products long-lasting durability and resistance to impacts. The end closures are manufactured from die-cast aluminium or an injection moulded thermoplastic material.

**INSTALLATION AND MAINTENANCE:** the electrical and control components are wired to terminal boards which simplify connections, and access to internal parts, for maintenance technicians only, is spacious while the components are arranged so they are easily identified.

**CUSTOM MADE:** the Customer takes priority and every device can be modified and tailored to their requirements.
